

## Dairy farm feedpad - Golden Bay

### PROJECT DESCRIPTION

Dairy farm feed lots or feed pads are easily built and reinforced using Forta Ferro macro synthetic fibre replacing traditional reinforcing such as steel mesh. By using Forta Ferro as the reinforcement you save time by not having to store, handle, place and cut as required with steel mesh.

Forta Ferro does not rust, is easily pumped or discharged straight from the ready mix truck and safe for dairy use as the fibres are soft and pliable. Forta Ferro is cost effective per m<sup>2</sup> and offers three dimensional reinforcement which enhances surface longevity greatly when compared to using steel mesh as the mesh does not improve abrasion or impact resistance.

Forta Ferro has been used in this type of application on many farms in Southland, Canterbury, Nelson / Marlborough regions. Is also ideal for silage pads, laneways and dairy shed yards

### KEY POINTS

- Ease of use
- Enhanced Performance
- Safe for cattle

### DETAILS

**Date:** 2012

**Location:** Golden Bay

**Fibre:** Forta Ferro<sup>®</sup>

**Dosage:** 2kg/m<sup>3</sup>

**Concrete Details:** 30MPa

**Concrete Supplier:** Concrete & Metals

**Contractor:** Concrete & Metals
